

Computational Phonology Workshop

Introduction & Tutorial

Thomas Graf

Stony Brook University
mail@thomasgraf.net
<http://thomasgraf.net>

Dec 12, 2016

Outline

- 1 The Subregular Enterprise
- 2 (Tier-Based) Strictly Local Phonotactics
- 3 Subregular Mappings for Phonology
- 4 (Tier-Based) Strictly Local Syntax

Computational View of Language

In formal language theory, string sets are classified according to their formal complexity.

regular < context-free < mildly context-sensitive < ...

Phonology

Morphology

Syntax

This allows predictions for

- ▶ typology (e.g. no center embedding in phonology)
- ▶ learning (required input, what must be in UG)
- ▶ cognitive architecture (type of memory, structural inference rules)

Computational View of Language

In formal language theory, string sets are classified according to their formal complexity.

regular < context-free < mildly context-sensitive < ...

Kaplan and Kay (1994)

Phonology

Morphology

Syntax

This allows predictions for

- ▶ typology (e.g. no center embedding in phonology)
- ▶ learning (required input, what must be in UG)
- ▶ cognitive architecture (type of memory, structural inference rules)

Computational View of Language

In formal language theory, string sets are classified according to their formal complexity.

regular < context-free < mildly context-sensitive < ...

Kaplan and Kay (1994)

Phonology

Karttunen et al. (1992)

Morphology

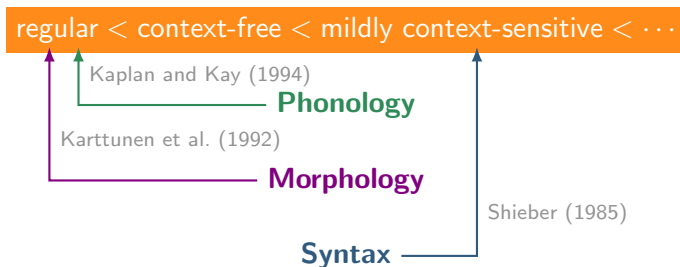

Syntax

This allows predictions for

- ▶ typology (e.g. no center embedding in phonology)
- ▶ learning (required input, what must be in UG)
- ▶ cognitive architecture (type of memory, structural inference rules)

Computational View of Language

In formal language theory, string sets are classified according to their formal complexity.

This allows predictions for

- ▶ typology (e.g. no center embedding in phonology)
- ▶ learning (required input, what must be in UG)
- ▶ cognitive architecture (type of memory, structural inference rules)

Computational View of Language

In formal language theory, string sets are classified according to their formal complexity.

This allows predictions for

- ▶ **typology** (e.g. no center embedding in phonology)
- ▶ **learning** (required input, what must be in UG)
- ▶ **cognitive architecture** (type of memory, structural inference rules)

Too Many Patterns are Regular

► Problem

- All phonological and morphological patterns are regular.
- But not all regular patterns occur in phonology.
- Regularity is **too loose an upper bound**.

Examples of Regular yet Unattested Patterns

- First-last consonant harmony
- Every word with a plosive contains an open syllable.
- Words with at least 3 suffixes must have exactly 5 prefixes.

Too Many Patterns are Regular

► Problem

- All phonological and morphological patterns are regular.
- But not all regular patterns occur in phonology.
- Regularity is **too loose an upper bound**.

Examples of Regular yet Unattested Patterns

- First-last consonant harmony
- Every word with a plosive contains an open syllable.
- Words with at least 3 suffixes must have exactly 5 prefixes.

Subregular Languages

Often forgotten: hierarchy of **subregular languages**

(McNaughton and Papert 1971; Rogers et al. 2010; Ruiz et al. 1998; Rogers and Pullum 2011; Heinz et al. 2011; Graf 2016)

Subregular Languages

Often forgotten: hierarchy of **subregular languages**

(McNaughton and Papert 1971; Rogers et al. 2010; Ruiz et al. 1998; Rogers and Pullum 2011; Heinz et al. 2011; Graf 2016)

Subregular Languages

Often forgotten: hierarchy of **subregular languages**

(McNaughton and Papert 1971; Rogers et al. 2010; Ruiz et al. 1998; Rogers and Pullum 2011; Heinz et al. 2011; Graf 2016)

SL: Strictly Local

- ▶ SL formalizes **local dependencies**.
- ▶ SL grammars are collections of markedness constraints that are
 - ▶ hard/non-violable,
 - ▶ locally bounded.

Strictly Local Grammars & Languages

SL_n grammar finite set of forbidden n -grams

SL_n language all strings except those with forbidden n -grams

Example: SL Constraints

Process	Constraint	Forbidden n -grams
Word-final devoicing	* [+voice] ⌘	z ⌘, v ⌘, ...
Intervocalic voicing	* V [-voice] V	asa , asi , ..., isa , isi , ..., afa , afi , ..., ifa , ifi , ...
CV template	*⌘ V * CC * VV * C ⌘	⌘ a , ⌘ i , ... pp , pb , ... bp , bb , ... aa , ai , ..., ia , ii , ... p ⌘, b ⌘, ...

SL is Too Weak

- ▶ SL grammars only handle locally bounded dependencies.
- ▶ But some processes in phonology are unbounded.

Samala Sibilant Harmony (Heinz 2015:16)

ʃtojonowonowaf

SL is Too Weak

- ▶ SL grammars only handle locally bounded dependencies.
- ▶ But some processes in phonology are unbounded.

Samala Sibilant Harmony (Heinz 2015:16)

ʃtojonowonowaf
* stojonowonowaf
* ʃtojonowonowas

Example: Stress Assignment

Culminativity every word has exactly one primary stress

Tier contains segments with primary stress
***n*-grams** ×× and śś

What TSL Cannot do

- ▶ **First-Last Harmony**

because first/last is not a segmental property

- ▶ **Plosive implies open syllable**

cannot enforce Boolean conditionals

- ▶ **Mix local and non-local dependencies**

e.g. sibilant harmony does not apply to sibilants followed by a nasal

Attested Patterns Beyond TSL?

- ▶ **Tone Plateauing** (but IBSP; Graf 2016)

- ▶ **Non-Final RHOL** [Baek's talk]

- ▶ **Multiple Harmony** [Aksënova's talk]

What TSL Cannot do

- ▶ **First-Last Harmony**

because first/last is not a segmental property

- ▶ **Plosive implies open syllable**

cannot enforce Boolean conditionals

- ▶ **Mix local and non-local dependencies**

e.g. sibilant harmony does not apply to sibilants followed by a nasal

Attested Patterns Beyond TSL?

- ▶ **Tone Plateauing** (but IBSP; Graf 2016)

- ▶ **Non-Final RHOL** [Baek's talk]

- ▶ **Multiple Harmony** [Aksënova's talk]

Complexity of Phonology

- ▶ All local phonological constraints are SL.
- ▶ All segmental long-distance constraints are TSL.
- ▶ Suprasegmental constraints (tone, stress) may go beyond TSL.
(Graf 2010a,b; Jardine 2015)

Cognitive Implications

- ▶ SL and TSL languages are **learnable** from positive data.
(Heinz et al. 2012; Jardine and Heinz 2016)
 - ▶ UG: specifies upper bound on size of n -grams
 - ▶ memorize which sequences have not been seen so far
 - ▶ induce tier (more complex)
 - ▶ learning input can be relatively small
- ▶ What cognitive resources are required?
 - ▶ Only memorization of the last n segments of a specific type
 - ▶ For most processes $n \leq 3$, and for all $n \leq 7$
 - ▶ Fits **within bounds of human working memory**

Interim Summary: Phonotactics

- ▶ Natural languages have **TSL phonotactics**.
- ▶ gives tighter bound on typology
- ▶ solves poverty of stimulus by greatly simplifying learning
- ▶ reduces cognitive resource requirements

Next

- ▶ phonological mappings
- ▶ SL & TSL syntax

Interim Summary: Phonotactics

- ▶ Natural languages have **TSL phonotactics**.
- ▶ gives tighter bound on typology
- ▶ solves poverty of stimulus by greatly simplifying learning
- ▶ reduces cognitive resource requirements

Next

- ▶ phonological mappings
- ▶ SL & TSL syntax

Phonological Mappings

- ▶ So far we have only considered phonotactics.
- ▶ But mappings from underlying representations to surface forms can be studied, too.
- ▶ Regular mappings are enough.
(Kaplan and Kay 1994)
- ▶ What about **subregular mappings**?

Strictly Local Mappings

Strictly Local (SL; Chandlee 2014)

- ▶ Move through string from left to right.
- ▶ Rewrite x as y based on previous n symbols in...
 - input string: input strictly local (**ISL**)
 - output string: output strictly local (**OSL**)
- ▶ Mapping never considers both input and output.

Example

SL₃-mapping: $V \rightarrow C \mid VC_$
Input string: CVCVCVCV

ISL Output

OSL Output

Strictly Local Mappings

Strictly Local (SL; Chandlee 2014)

- ▶ Move through string from left to right.
- ▶ Rewrite x as y based on previous n symbols in...
 - input string: input strictly local (**ISL**)
 - output string: output strictly local (**OSL**)
- ▶ Mapping never considers both input and output.

Example

	ISL Output	OSL Output
SL₃-mapping: $V \rightarrow C \mid VC_$		
Input string: CVCVCVCV	CVCVCVCV	CVCVCVCV

Strictly Local Mappings

Strictly Local (SL; Chandlee 2014)

- ▶ Move through string from left to right.
- ▶ Rewrite x as y based on previous n symbols in...
 - input string: input strictly local (**ISL**)
 - output string: output strictly local (**OSL**)
- ▶ Mapping never considers both input and output.

Example

	ISL Output	OSL Output
SL₃-mapping: $V \rightarrow C \mid VC_$	CVCVCVCV	CVCVCVCV
Input string: CVCVCVCV		

Strictly Local Mappings

Strictly Local (SL; Chandlee 2014)

- ▶ Move through string from left to right.
- ▶ Rewrite x as y based on previous n symbols in...
 - input string: input strictly local (**ISL**)
 - output string: output strictly local (**OSL**)
- ▶ Mapping never considers both input and output.

Example

SL₃-mapping: $V \rightarrow C \mid VC_$
Input string: CVCVCVCV

ISL Output

CVCVCVCV
 C

OSL Output

CVCVCVCV

Strictly Local Mappings

Strictly Local (SL; Chandlee 2014)

- ▶ Move through string from left to right.
- ▶ Rewrite x as y based on previous n symbols in...
 - input string: input strictly local (**ISL**)
 - output string: output strictly local (**OSL**)
- ▶ Mapping never considers both input and output.

Example

SL₃-mapping: $V \rightarrow C \mid VC_$
Input string: CVCVCVCV

ISL Output

CVCVCVCV
 C

OSL Output

 - input string: input strictly local (**ISL**)
 - output string: output strictly local (**OSL**)
- ▶ Mapping never considers both input and output.

Example

	ISL Output	OSL Output
SL₃-mapping: $V \rightarrow C \mid VC_$	CVCVCVCV	CVCVCVCV
Input string: CVCVCVCV	CVCCCCCC	CVCCCV

Strictly Local Mappings

Strictly Local (SL; Chandlee 2014)

- ▶ Move through string from left to right.
- ▶ Rewrite x as y based on previous n symbols in...
 - input string: input strictly local (**ISL**)
 - output string: output strictly local (**OSL**)
- ▶ Mapping never considers both input and output.

Example

	ISL Output	OSL Output
SL₃-mapping: $V \rightarrow C \mid VC_$	CVCVCVCV	CVCVCVCV
Input string: CVCVCVCV	CVCCCCCC	CVCCCCV

Strictly Local Mappings

Strictly Local (SL; Chandlee 2014)

- ▶ Move through string from left to right.
- ▶ Rewrite x as y based on previous n symbols in...
 - input string: input strictly local (**ISL**)
 - output string: output strictly local (**OSL**)
- ▶ Mapping never considers both input and output.

Example

	ISL Output	OSL Output
SL₃-mapping: $V \rightarrow C \mid VC_$	CVCVCVCV	CVCVCVCV
Input string: CVCVCVCV	CVCCCCCC	CVCCCV

Strictly Local Mappings

Strictly Local (SL; Chandlee 2014)

- ▶ Move through string from left to right.
- ▶ Rewrite x as y based on previous n symbols in...
 - input string: input strictly local (**ISL**)
 - output string: output strictly local (**OSL**)
- ▶ Mapping never considers both input and output.

Example

	ISL Output	OSL Output
SL₃-mapping: $V \rightarrow C \mid VC_$	CVCVCVCV	CVCVCVCV
Input string: CVCVCVCV	CVCCCCCC	CVCCVC

Example

	ISL Output	OSL Output
SL₃-mapping: $V \rightarrow C \mid VC_$	CVCVCVCV	CVCVCVCV
Input string: CVCVCVCV	CVCCCCCC	CVCCCCVCC

How Many Processes are SL?

- ▶ All locally bounded processes
assimilation, dissimilation, vowel harmony, even metathesis
- ▶ **But:** mappings where local processes interact may not be SL
multiple metathesis **[Takahasi's talk]**
- ▶ Some processes are not locally bounded and thus not SL.
sibilant harmony, tone plateauing, sour grapes harmony

A Note on TSL

Every TSL_n grammar can be decomposed into

- 1 an **ISL₁** function (the tier projection), and
- 2 an SL_n grammar.

An Interesting Puzzle

- ▶ What happens if we use an ISL_k function for tier projection?
- ▶ Addressed in **Aniello De Santo's** talk

A Note on TSL

Every TSL_n grammar can be decomposed into

- 1 an **ISL₁** function (the tier projection), and
- 2 an SL_n grammar.

An Interesting Puzzle

- ▶ What happens if we use an ISL_k function for tier projection?
- ▶ Addressed in **Aniello De Santo's** talk

(Tier-Based) Strictly Local Syntax

- ▶ SL tree grammars are common in computational linguistics:
context-free grammars
- ▶ By adding tier projection, we get TSL tree grammars.

Example: CFGs as SL_2 Tree Grammars

S → NP VP
NP → John
VP → cried

Example: An Illicit Tree

SL₂ Tree Grammar

Example Tree

Tree Bigrams of Example Tree

Tier Projection for Trees

Just as for strings, we can project tiers for trees.
(Graf and Heinz 2016)

Towards TSL-Syntax

While TSL-Syntax is still young, it holds promise:

- ▶ movement dependencies are TSL (Graf and Heinz 2016)
- ▶ Mandarin negation in **Hongchen Wu's talk**
- ▶ scope ambiguities in **Lei Liu's blitz talk**
